What is Pest?

➢ Pest - Derived from French word ‘Peste’ and

➢ Latin term ‘Pestis’ meaning plague or contagious disease

✓ Pest is any animal which is noxious, destructive or troublesome to man or his interests.

✓ A pest is any organism which occurs in large numbers and conflict with man’s welfare, convenience and profit.

✓ A pest is an organism which harms man or his property significantly or is likely to do so (Woods, 1976).

Insects are pests when they are sufficiently numerous to cause economic damage (Debacli, 1964).

Pests are organisms which impose burdens on human population by causing

➢ Injury to crop plants, forests and ornamentals,

➢ Annoyance, injury and death to humans and domesticated animals

➢ Destruction or value depreciation of stored products.

➢ include insects, nematodes, mites, snails, slugs, etc. and vertebrates like rats, birds, etc.

➢ Depending upon the importance, pests may be

✓ agricultural forest, household, medical, aesthetic and veterinary pests.
CATEGORIES OF PESTS:

Based on occurrence following are pest categories:

✓ **Regular pest:** Frequently occurs on crop - Close association  
   e.g. Rice slem borer, Brinjal fruit borer

✓ **Occasional pest:** Infrequently occurs, no close association  
   e.g. Caseworm on rice, Mango stem borer

✓ **Seasonal pest:** Occurs during a particular season every year  
   e.g. Red hairy caterpillar on groundnut, Mango hoppers

✓ **Persistent pests:** Occurs on the crop throughout the year and is difficult to control  
   e.g. Chilli thrips, mealy bug on guava

✓ **Sporadic pests:** Pest occurs in isolated localities during some period.  
   e.g. Coconut slug caterpillar
Based on level of Pest infestation

- **Epidemic Pest:** Sudden outbreak of a pest in a severe form in a region at a particular time.  
  e.g. RHC in Madurai, Pollachi, BPH in Tanjore

- **Endemic Pest:** Occurrence of the pest in a low level in few pockets, regularly & confined to particular area.  
  e.g. Mango hoppers in Periyakulam, Rice gall midge in Madurai

**Parameters of Pest population levels**

- **General equilibrium position (GEP):** The average density of a population over a long period of time, around which the pest population tends to fluctuate due to biotic and abiotic factors and in the absence of permanent environmental changes.

- **Economic threshold level (ETL):** Population density at which control measure should be implemented to prevent an increasing pest population from reaching the ETL.

- **Economic injury level (EIL):** The lowest population density that will cause economic damage.

- **Damage boundary (DB):** The lowest level of damage which can be measured. **ETL is always less than EIL.**  
  Provides sufficient time for control measures.
PEST CATEGORIES BASED ON PEST POPULATION LEVELS

(1) Key pest: Most severe and damaging pests
- GEP lies above EIL always
- Spray temporarily bring population below EIL
- These are persistent pests
- The environment must be changed to bring GEP below EIL
e.g. Diamond backmoth, Cotton bollworm,

(2) Major pest: Economic damage can be prevented by timely and repeated sprays
- GEP lies very close to EIL or coincides with EIL
  e.g. Rice stem borer, Cotton jassid

(3) Minor pest/Occasional pest: Can be controlled by spraying
- GEP is below the EIL usually
- Rarely they cross EIL
  e.g. Ash weevils, Cotton stainers, Rice hispa

(4) Sporadic pests: GEP generally below EIL
- Sometimes it crosses EIL and cause severe loss in some places/periods
  e.g. Sugarcane pyrilla, Hairy caterpillar, White grub

(5) Potential pests: They are not pests at present
- GEP always less than EIL If environment changed may cause economic loss
  e.g. S. litura is potential pest in North India
What is pesticide?

**Pesticide**: Pesticide is a substance which kills a pest. Any substance or mixture of substances intended for preventing, destroying, repelling, or mitigating any pest (insect, rodent, nematode, fungus, weed, other forms of terrestrial or aquatic plant or animal life or viruses, bacteria, or other microorganisms on or in living man or other animals), which the administrator declares to be pest, and any substance or mixture of substances intended for use as a plant regulator, defoliant, or desiccant.

As per the Insecticides Act 1968, any substance which is in the schedule, or Such other substances as the central government may, after consultation with the Board, by notification in the official gazette, include in the schedule from time to time or Any preparation containing any one or more of such substances is a pesticide.

The Pesticides can be classified in many ways on the basis of use, toxicity, mode of entry, mode of action, chemistry and formulations.

**Pesticide: Pest + cide**

- Pest meaning insect, rodent, nematode, fungus, weed, other forms of terrestrial or aquatic plant or animal life or viruses, bacteria, or other microorganisms on or in living man or other animals

- cide: meaning intended for preventing, destroying, repelling, or mitigating
Pesticide classification based on the basis of their use:

- **Acaricides**: are the substances that are used to kill mites and ticks, or to disrupt their growth or development. e.g. Fipronil, bifenthrin, cyhalothrin, fluvalinate, permethrin & chlorfenapyr etc.

- **Algicide**: are the substances that are used to kill or inhibit algae. e.g. copper sulfate, diuron & isoproturon etc.

- **Antifeedants**: are the chemicals which prevent an insect or other pest from feeding. e.g. Fentin and azadirachtin etc.

- **Avicides**: are the chemicals that are used to kill birds. e.g. fenthion & strychnine etc.

- **Bactericides**: are the compounds that are isolated from or produced by a microorganism (e.g. a bacterium or a fungus), or a related chemical that is produced artificially. which are used to kill or inhibit bacteria in plants or soil. e.g. copper hydroxide, kasugamycin, streptomycin & tetracycline etc.

- **Bird repellents**: are the chemicals which act as the bird repellants e.g. copper oxychloride, diazinon, methiocarb, Thiram & ziram etc.

- **Chemosterilant**: are the chemicals that renders an insect infertile and thus prevents it from reproducing. e.g: diflubenzuron

- **Fungicides**: are the chemicals which are used to prevent, cure eradicate the fungi e.g. Bordeaux mixture, copper oxychloride & captan etc.

- **Herbicide softeners**: A chemical that protects crops from injury by herbicides, but does not prevent the herbicide from killing weeds. e.g. benoxacor, cloquintocet, cyometrnil & cyprosulfamide etc.
➢ **Herbicides:** are the substances that are used to kill plants, or to inhibit their growth or development.

  e.g. Paraquat, atrazine, isoproturon, linuron, metoxuron, chlorimuron & sulfosulfuron etc.

➢ **Insect attractant:** A chemical that lures pests to a trap, thereby removing them from crops, animals or stored products. e.g. Gossypure, Gyplure, Muscalure (name ends with lure as they lure the pests)

➢ **Insect repellents:** A chemical that deters an insect from landing on a human or an animal. e.g. Citronella oil & Permethrin etc.

➢ **Insect Growth regulator:** A substance that works by disrupting the growth or development of an insect e.g. Diflubenzuron & buprofezin etc.

➢ **Insecticides:** A pesticide that is used to kill insects, or to disrupt their growth or development. e.g. azadirachtin & deltamethrin etc.

➢ **Mammal repellents:** A chemical that deters mammals from approaching or feeding on crops or stored products.

➢ **Mating disrupters:** are the chemicals that interfere with the way that male and female insects locate each other using airborne chemicals (pheromones), thereby preventing them from reproducing.

➢ **Molluscicides:** are the substances used to kill slugs and snails. e.g. copper sulfate, metaldehyde & thiodicarb etc.

➢ **Nematicides:** are the chemicals which are used to control Nematodes. e.g. abamectin, benomyl & triazophos etc.
➢ **Plant growth regulators**: are the substances that alters the expected growth, flowering or reproduction rate of plants. e.g. 2,4-D, α-naphthaleneacetic acid, ethephon, metoxuron & gibberellic acid etc.

➢ **Rodenticides**: are the substances used to kill rats and related animals. e.g. strychnine, bromadiolone, coumachlor, coumatetralyl, warfarin, zinc phosphide, Lindane & aluminium phosphide etc.

➢ **Synergists**: A chemical that enhances the toxicity of a pesticide to a pest, but that is not by itself toxic to the pest. e.g. piperonyl butoxide

➢ **Virucide**: an agent having the capacity to destroy or inactivate viruses. e.g. Ribavirin (not available in India)

➢ **Miscellaneous**: e.g. aluminium phosphide, sodium cyanide etc.

➢ **Biologicals**: e.g. Viruses, bacteria, fungi, and plants Nematodes, insects and other parasites or predators

**Fertilizers and other plant nutrients are not included in term “Pesticides”**
The pesticide use and legislation was studied in 1964-67 by an Expert Committee of Indian Council of Agricultural Research headed by Prof. M.S. Thacker.

Based on the recommendations of the Expert Committee a comprehensive Insecticides Act was passed in 1968
- to regulate the import, manufacture, sale, transport, distribution
- use of insecticides with a view to prevent risks to human beings and animals and for other matters connected therewith.

For the effective enforcement of the Insecticides Act, the two bodies have been constituted at the Central level viz.

Central Insecticides Board and

Registration Committee.

Insecticides Act, 1968

Insecticides Rules, 1971
Central Insecticide Board and Registration Committee (CIB&RC)
Latest information about Pesticides use in India (till 29.02.2020)

➢ 40 Pesticides Banned for manufacture, import and use

➢ 04 Pesticide formulations banned for import, manufacture and use

➢ 02 Pesticide / Pesticide formulations banned for use but continued to manufacture for export

➢ 08 Pesticides Withdrawn

➢ 18 Pesticides refused registration

➢ 09 Pesticides restricted for use in country

➢ 06 Pesticides to be phase out by 31st December, 2020

➢ 289 Pesticides Registered under section 9(3) of the Insecticides Act, 1968 for use in the Country

➢ 736 Total Formulation Registered for use in the Country under Insecticides Act, 1968
